# Agenda

1. Introduction
2. Get your RSK node.
3. Remix
4. Netherum
5. Implement Web API using Netherum for RSK

# Internet of Knowledge

# Internet of Value

@RSKSMART  
#SMARTERBITCOIN

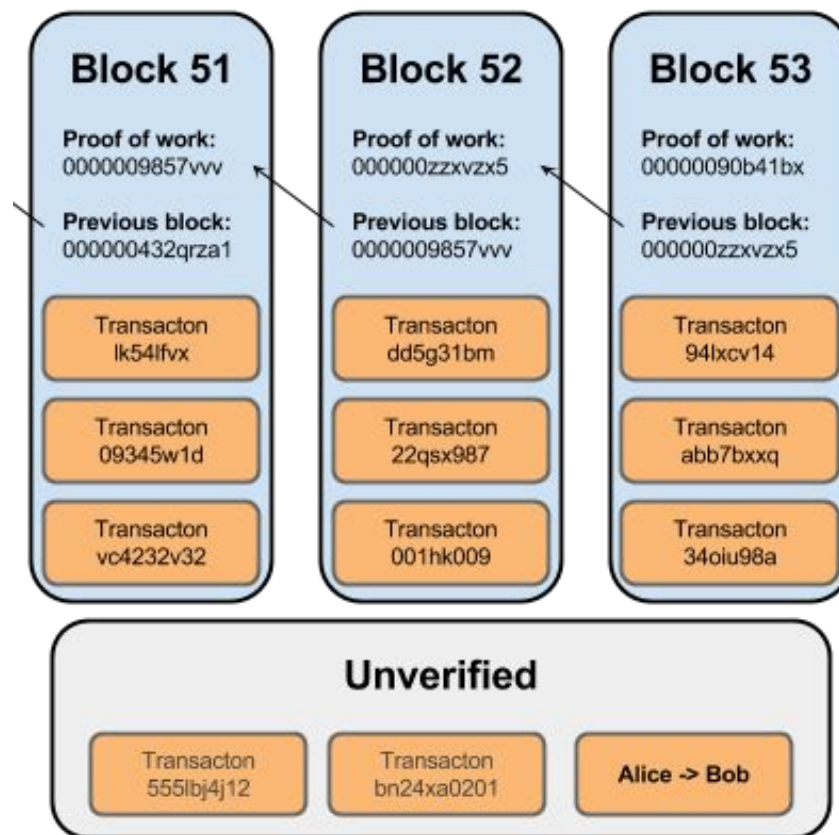

# What is Bitcoin?

- First global decentralized value transfer network
- Transfers are almost immediate no matter where
- Fixed function for bitcoin emission

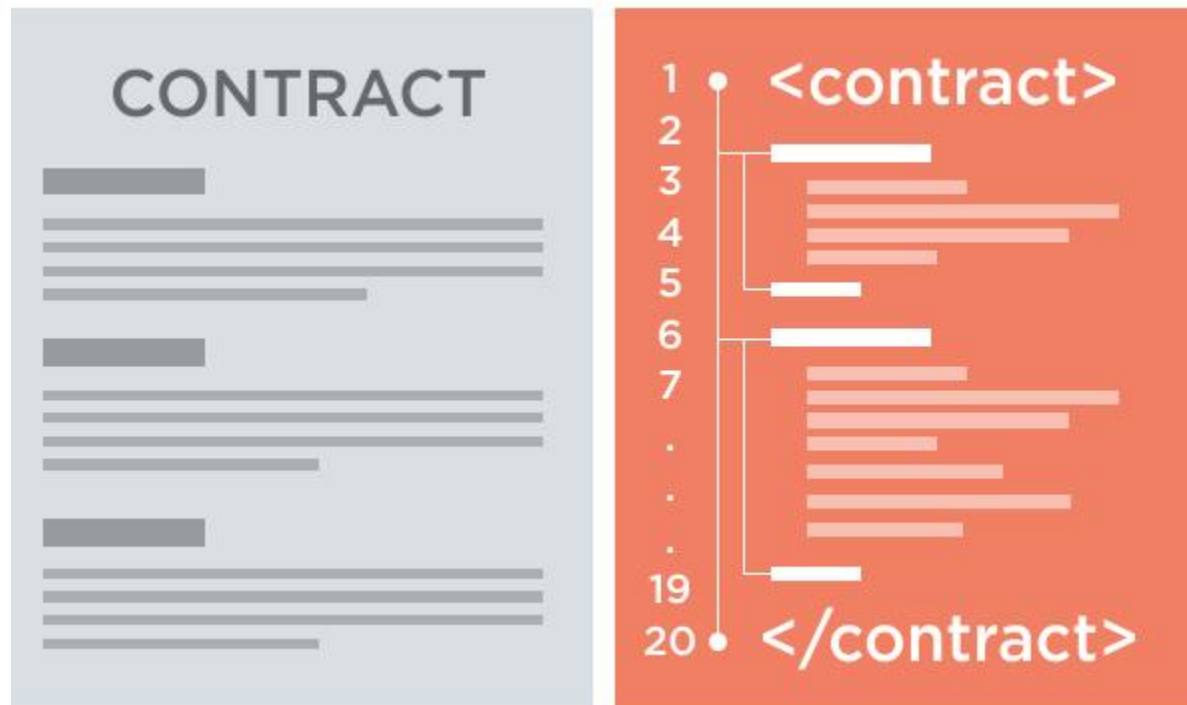

# What is Blockchain?

# Smart Contracts

- trustless
- autonomous
- self-sufficient.

# Intro to RSK

# Five pillars

1. Ethereum compatibility

2. Bitcoin - RSK Bridge (2WP)

3. Merged Mining

4. Global federation

5. Community

# Five pillars

1. Ethereum compatibility

2. Bitcoin - RSK Bridge (2WP)

3. Merged Mining

4. Global federation

5. Community

# 1. Ethereum compatibility

- RSK started as a fork of the EVM
- Your Solidity contract can run in RSK network without changing code!

# Five pillars

1. Ethereum compatibility

**2. Bitcoin - RSK Bridge (2WP)**

3. Merged Mining

4. Global federation

5. Community

## 2. Bitcoin - RSK Bridge (2WP)

## 2. Bitcoin - RSK Bridge (2WP)

SMART BITCOIN

- The Smart Bitcoin (or RBTC) is a conversion of the original Bitcoin residing in the RSK network
- 1:1 conversion rate with Bitcoin
- The 2-way peg is used to convert from one to the other

# Five pillars

1. Ethereum compatibility

2. Bitcoin - RSK Bridge (2WP)

**3. Merged Mining**

4. Global federation

5. Community

### 3. Merged Mining

- Allows a miner to mine more than one blockchain at the same time
- Every hash the miner does contributes to the total hash rate of both networks

### 3. Merged Mining

- The RSK Network is secured by the Bitcoin miners
- The Bitcoin miners increase their revenue at zero extra cost
- RSK leverages the Bitcoin security to create the most secure Smart Contract platform
- RSK enables the Bitcoin miners to form part of the Smart Contracts business

# Five pillars

1. Ethereum compatibility

2. Bitcoin - RSK Bridge (2WP)

3. Merged Mining

**4. Global federation**

5. Community

## 4. Global federation

- Act as the bitcoin guardians on the Bitcoin-RSK Bridge
- Provide additional services:
  - Generation of external security checkpoints
  - Active oracling services
- 25 of the most recognized companies in the industry

# Five pillars

1. Ethereum compatibility

2. Bitcoin - RSK Bridge (2WP)

3. Merged Mining

4. Global federation

5. Community

# Get your RSK node (in Azure)

1. Review RSK Wiki  
(<https://github.com/rksmart/rskj/wiki/install-rskj-using-azure>)
2. Go to Azure Portal
3. Create a resource
4. Search for RSK, choose the node's version and click Create.
5. Wait for Azure to finish the deployment.
6. Initialize RSK node configuration file settings.

# RSK Public Nodes

- <https://public-node.testnet.rsk.co>
- <https://public-node.rsk.co>
- <https://lb-publicnode-test.rsklabs.io/>
- Here's an example request using cURL to get the Testnet block number:

```
$ curl https://public-node.testnet.rsk.co -X POST -H "Content-Type: application/json" --data '{"jsonrpc": "2.0", "method": "eth_blockNumber", "params": [], "id": 1}'
```

# What is Remix?

- Remix is a powerful, open source tool that helps you write Solidity contracts straight from the browser. Written in Javascript, Remix supports both usage in the browser or locally.
- [HelloNetconfUY Example!](#)

# What is Nethereum?

Nethereum is the .Net integration library for Ethereum (compatible with RSK), simplifying the access and smart contract interaction with Ethereum and RSK nodes.

# Implement Web API for RSK

- Use Netherium, .NET Core, Swagger.
- Start from here: <https://github.com/jonathansmirnoff/RskManager>
- Review Netherium wiki:  
<https://netherium.readthedocs.io/en/latest/>
- <https://faucet.testnet.rsk.co/>
- Let's try to implement this methods for the API:
  - Get block number
  - Get balance for an account
  - Transfer value to an address
  - Deploy contract

# Implement Web API for RSK

- Call to **CreatNewAccount** and save the result!
- Go to <https://faucet.testnet.rsk.co/> and send some rbtc to the account
- Check using explorer (<https://explorer.testnet.rsk.co/>) and with using the method **Balance**
